Fossil Evidence of Evolution

Key Concept How do fossils form?

Directions: Answer each question in the space provided.

Fossil Formation			
What are the different types of fossils?	What conditions existed for this type of fossil to form?	How did this type of fossil form?	Does this fossil show physical structure, movement, or behavior—or all three?
1. mineralization	mud, sand, or other sediment in a stream or river	The remains of a dead organism are buried. Minerals in water replace the organism's original material and harden into rock.	Physical structure
2. Carbonization	Compression over a long time	a dead organism is compressed over time. Pressure drives off the organism's liquid and gases, leaving only the carbon outline or film.	Physical structure
3. molds and casts	mud or sand	The shell or bone of an organism leaves an impression (mold). Sediments later fill the mold and harden into cast.	Physical structure
4. trace fossils	mud	An organism walks across mud. The tracks fill in with sediment that hardens.	Physical structure, movement, or behavior
5. original material	ice, tar pits, amber	The remains of an entire organism are found in ice, tar pits, or encased in amber.	Physical structure and possibly movement or behavior
